

Targil 2 (work in pairs)
Submission until 7/1/2018

The goal of this exercise is to implement a rule based machine learning algorithm a weakened version of Associative rule learning algorithm. [link](#)

What we are trying to implement is similar to google feature of related searches.

Read this article *Using association rules to discover search engines related queries*

According rule associative rule learning algorithm.

Given pair of (user id , search query)

Discover related search queries.

For query S_x show $\{S_x\} \Rightarrow \{S_y\}$ with confidence C_{xy} using associative rule learning algorithm.

1. Implement the algorithm and run it over search queries dataset the output should be S_x , S_y , confidence $S_x \Rightarrow S_y$ with confidence
2. Save the output in a files
3. Prepare a document that explains the workflow of the algorithm.
4. Run the algorithm with 3 different confidence 0.6 / 0.8 / 0.9
 - a. Write the amount related queries for each confidence
 - b. Look for 3 interesting relations found in the date set
5. Not external library is allowed.

A dataset for the algorithm can be found here [link](#)
